

# Öland – the island of sun and wind

There's a good reason for the name: Öland tops the charts for summer sunshine hours. It's wonderful in many ways – but not ideal for the groundwater.

Northern and southern Öland are among the driest places in Sweden. In normal years, the island has a steppe-like climate, and during dry years, even desert-like conditions.

That's why it's so important that we all use water wisely.
